ABSTRACT

This report summarizes some recent changes in the characteristics of households and families, presenting detailed data from the March 1984 Current Population Survey. Highlights of the topics discussed include the following: (1) Married-couple families with children under 18 constituted about 29 percent of all households in 1984, slightly below the corresponding proportion for 1980 but substantially less than the 1970 level of 40 percent; (2) One-parent family situations accounted for 26 percent of all "family groups" with children under 18 in 1984, as compared with 22 percent in 1980 and 13 percent in 1970; (3) The proportion of black family households maintained by women alone in 1984 was more than three times the proportion among whites; (4) The average number of persons per household reached a new low of 2.71 in 1984, down from 3.14 in 1970 and 2.76 in 1980. Data presented in the seven tables in the text and in 25 additional tables were based on surveys and not a complete census and are therefore subject to sampling variability. Appendices provide definitions and explanations of terms and a discussion of sampling variability. (RH)

Household and Family Characteristics: March 1984

INTRODUCTION AND HIGHLIGHTS

This report summarizes some of the recent changes in the characteristics of households and families, and presents detailed data on the subject from the March 1984 Current Population Survey. Changes in household composition have important implications not only for private sector analysts trying to gauge potential demand for consumer products, but also for public policy makers concerned with the conditions in which people live. Highlights of the topics discussed in this year's report are:

- Married-couple families with children under 18 years old constituted about 29 percent of all households in 1984, slightly below the corresponding proportion for 1980, but substantially less than the 1970 level which was 40 percent.

- One-parent family situations accounted for 26 percent of all "family groups" with children under 18 in 1984, compared with 22 percent in 1980 and 13 percent in 1970.

- The proportion of Black family households maintained by women alone in 1984 was more than three times the proportion among Whites.

- The average number of persons per household reached a new low of 2.71 in 1984, down from 3.14 in 1970 and 2.76 in 1980.

An advance report of the 1984 data was issued in August 1984 (Current Population Reports, Series P-20, No. 391, *Households, Families, Marital Status, and Living Arrangements: March 1984*). Related statistics on age at first marriage, divorce ratios, unmarried couples, and the living arrangements of children and adults are available in the forthcoming *Marital Status and Living Arrangements: March 1984*, a report in which persons, instead of households, are the primary units of analysis.

The data in this report are based on surveys and are subject to sampling variability since they are not based on a complete census of the population. Caution should be exercised when using estimates based on a small number of cases, particularly if the difference between two numbers being compared is small. For a complete discussion of sampling variability, see Appendix B, "Source and Reliability of Estimates."

COMPOSITION OF HOUSEHOLDS

There were 85.4 million households in the United States in March 1984, according to the results of the Current Population Survey (table A). The Census Bureau identifies two major household categories: family and nonfamily. A family household comprises a householder (a person who owns or rents the living quarters) and at least one other person related to the householder by birth, marriage, or adoption. In a nonfamily household, no relatives of the householder are present, though in a few instances some members of the household who are not related to the householder are related to each other.

Family households. Approximately 62.0 million households in 1984 were family households. These households accounted for 53 percent of the increase in households since 1980, compared with 47 percent of the increase during the 1970's.[1]

Family households have enlarged their share of total household growth, but this pattern is not reflected across all types of families. The Census Bureau identifies three types of family households: married-couple families, other families with male householder (no wife present), and other families with female householder (no husband present). Married-couple families accounted for 21 percent of the households added since 1980, compared with 25 percent during the 1970-80 period.[2] By contrast, the percentage of total household increase attributable to other families with male householder (no wife present) was 6 percent for 1980-84 versus 3 percent during the decade of the 1970's, indicating some evidence of a difference between the two periods. Family households maintained by women with no husbands present represented about 25 percent of the households added since 1980; this represents some evidence of an increase over their 18 percent share during the 1970-80 period.

Married-couple families with children under 18 accounted for 29 percent of all households in 1984, slightly below the corresponding proportion of 31 percent for 1980, but substantially less than their 40 percent share of all households in 1970. Although their share of total households has fallen

---

[1] The difference in the two percentages is not considered statistically significant.

[2] The difference between the 1970-80 and 1980-84 percentages is not statistically significant.

- Represents zero.

by only 2 percentage points since 1980, the drop in the number of two-parent families over the past 4 years has been comparable in size to that experienced over the entire 10-year period between 1970 and 1980.

Nonfamily households. About 23.4 million households in 1984 were maintained by nonfamily householders. The proportion of all households with a nonfamily householder was about the same in 1984 as in 1980 (27 percent and 26 percent, respectively), up from about 19 percent in 1970.

Most nonfamily households are maintained by persons living alone (85 percent in 1984). About 12 percent of all households added since 1980 were men living alone, much lower than the corresponding 20 percent in the 1970-80 period. Women living alone, by contrast, accounted for about the same proportion of households added during both the 1980-84 and the 1970-80 periods (24 percent and 23 percent of the total increase, respectively).

Differences by race and origin. There are dramatic differences in the household composition of Whites and Blacks. Although these differences existed in 1970, some of them were larger by 1984. For example, married-couple families accounted for 73 percent of White households in 1970 (table B), compared with only 53 percent of Black households (a difference of 20 percentage points). The corresponding proportions in 1984 were 61 percent for Whites versus 37 percent for Blacks. (The difference had grown slightly to 24 percentage points.) Thus, although the proportion of married-couple families declined for both racial groups, the decline among Blacks was somewhat greater.

The proportion of Black family households maintained by women alone in 1984 was 31 percent, more than three times the proportion among White households (9 percent). Families maintained by men alone also constituted a higher proportion of Black than White households, 4 percent versus 2 percent. Nonfamily households represented about the same percentage of total households among both Whites and Blacks (28 percent), but the Black nonfamily householders were somewhat less likely than Whites to be women.

Among households maintained by persons of Spanish origin in 1984, 60 percent were married-couple families, 19 percent were families maintained by women alone, 4 percent were families maintained by men alone, and 18 percent were nonfamily households. Compared with 1970, married-couple families represented a smaller proportion of Spanish-origin households in 1984, whereas families maintained by women enlarged their share of the total.

Age of householder. The median age of all householders in 1984 was 45.6 years, compared with 46.1 years in 1980, and 48.1 years in 1970 (table C). The small decline in median

[1] Persons of Spanish origin may be of any race. 1970 Spanish origin data from 1970 Census of Population, Vol. II, 1C, table 5.

age since 1980 occurred despite a drop of 1.1 million in the number of the youngest group of householders (i.e., those under 25 years of age). The decrease in householders under 25 did not lead to a rise in the median age of householders because it was more than offset by a 3.9-million increase over the 4-year period in the number of householders 25 to 44 years old, as large numbers of the postwar baby boom generation moved toward middle age.

ONE-PARENT FAMILY GROUPS

About 26 percent of all "family groups" with children under 18 were one-parent situations in 1984, compared with 22 percent in 1980 and only 13 percent in 1970 (table D). Family groups include not only family households, but also related subfamilies and unrelated subfamilies. For a detailed description of subfamilies, see the definitions section. Prior to 1980,

Table C. Age of Householder: 1984, 1980, and 1970

[1] Includes divorced.

Note: Family groups consist of family households, related subfamilies, and unrelated subfamilies.

the concept of "families" used in the Current Population Survey included family households and unrelated subfamilies, but in more recent years the count of families has included only family households. There has, however, been continued interest in the living arrangements of one-parent subfamilies, and this section presents data for the more inclusive "family group" concept and its components.

Until 1982, Census Bureau estimates of the number of subfamilies were made on the basis of a clerical coding procedure utilizing questionnaire entries on relationship, marital status, age, sex, children, etc. In order to move toward the implementation of a computerized family coding procedure, a mechanism designed to clarify relationships between various household members (i.e., parent's and spouse's line numbers) was introduced on the form for the first time in 1982. This technical refinement in coding procedures permitted easier and more complete identification of subfamilies, resulting in a substantial increase in their number. The new computerized family coding procedures were made fully operational in 1983.

The percentage of subfamilies with a lone parent is much larger than the corresponding percentage of family households. In 1984, one-parent situations represented 22 percent of family households, 81 percent of related subfamilies, and 95 percent of unrelated subfamilies. A one-parent situation is usually created in one of several ways: premarital birth, separation, divorce, or widowhood. Since the number of widowed parents declined between 1970 and 1984, all of the increase during this period was due to the other factors.

About 89 percent of the parents in one-parent family groups in 1984 were women. A majority (69 percent) of these women either had never been married or were divorced. Although most of the never-married mothers lived in their own households (table E), they were much more likely than the divorced mothers to be living as a related subfamily with a parent or some other relative (38 percent of the never-married versus 8 percent of the divorced mothers).

The father was the lone parent in about 3 percent of the family groups with children under 18 in 1984, compared with 2 percent in 1980, and 1 percent in 1970. Lone fathers in one-parent family groups were less likely than lone mothers to be part of a subfamily sharing the home of a relative or someone else.

The incidence of one-parent situations is much higher among Blacks than Whites. In 1984, 59 percent of all Black family groups with children were one-parent situations (table D), compared with 20 percent among Whites. The corresponding proportions in 1980 were 52 percent for Blacks and 17 percent for Whites, and in 1970, one-parent situations accounted for 36 percent of Black family groups with children but only 10 percent among Whites. The proportion of one-parent family groups has increased within both of these racial groups since 1970, but the gap between Blacks and Whites in the proportion of one-parent family groups has widened considerably.

Despite the high incidence of lone parents among Blacks, 65 percent of all such family groups in 1984 were maintained by Whites. The corresponding proportions were 67 percent in 1980 and 69 percent in 1970.[3]

None of these data on one-parent situations should be interpreted as explicitly reflecting the child custody rulings of local courts. The numbers are based entirely on current living arrangements of parents and children as reported at the time of the survey.

SELECTED CHARACTERISTICS OF HOUSEHOLDS

Area of residence. Approximately 69 percent of all households were in metropolitan areas in 1984 (table F), about the same

proportion as in 1970.[4] The metropolitan areas used in this report are based on the standard metropolitan statistical areas (SMSA's) as defined in the 1970 census, permitting a comparison within constant boundaries.

Region. The Northeast contained 21 percent of all households in 1984, 25 percent were in the Midwest (formerly the North Central Region), 34 percent were in the South and 20 percent were in the West.

Age of householder. The median age of the 85.4 million persons maintaining households in 1984 was 45.6 years. Persons maintaining family households were younger (median age of 44.3 years) than persons maintaining nonfamily households (median age of 53.9 years). This age differential is not surprising since family householders include many younger adults with children, whereas nonfamily householders include a significant number of older persons (often widows) living alone. Females constituted 58 percent of all nonfamily householders, and their median age (63.6 years) was much higher than that of their male counterparts (37.9 years).

Marital status. Households in 1984 were maintained primarily by married persons. In about 59 percent of households, the householders were not only married but were also currently living with their spouses. An additional 5 percent of households were maintained by married persons whose spouses were absent because of legal separations or other reasons. About the same percentage of householders were widowed as had never been married (13 percent), and 11 percent of householders were divorced. These proportions refer to marital status at the time of the survey. The data from the March survey do not indicate how many householders may have ever been divorced, widowed, etc., at some time in the past. For example, if a previously divorced person has remarried and is married at the time of the survey, they will be shown as "married" in these data.

Size of household. The average number of persons per household dropped from 2.73 persons in 1983 to a new low of 2.71 persons in 1984. The recent period of decline in household size which began in the mid-1960's was interrupted in 1983 but resumed during the past year. Disproportionate increases in one-person households and smaller numbers of children per family account for most of the overall decline in household size. In 1984, about 23 percent of households contained one person, 32 percent two persons, 18 percent three persons, 16 percent four persons, 7 percent five persons, 3 percent six persons, and 2 percent seven or more persons (table F). Average household size varies by type of household. Married-couple households averaged 3.32 persons, compared with 3.11 persons for families maintained by women alone and 2.97 for those maintained by men alone.[5] Nonfamily households had an average size of only 1.33 persons for male householders and 1.12 for female householders.

Presence of children. Only about 36 percent of all households included one or more of the householder's own children under 18 years old in 1984. About half of all family households had such children in the home, although many of the households without children may have had a child in the past or may have one in the future. Children were more likely to be present in families maintained by women whose husbands were not present (60 percent), than in married-couple families (49 percent), or families maintained by men whose wives were not present (39 percent). Nonfamily households, by Census definition, do not contain any children related to the householder, although a few nonfamily households do include some children who are not related to the householder.

Nonrelatives in household. The vast majority of households include only householders and their relatives. Nonrelatives of the householder were present in only 6 percent of all households in 1984. Roommates, boarders, live-in employees, and other persons not related to the householder are among those considered to be nonrelatives. Family households were much less likely than nonfamily households to include nonrelatives; only 2 percent of family households contained one or more nonrelatives, compared with 15 percent of nonfamily households. Most unmarried couples and all group households shared by up to eight persons unrelated to the householder are examples of nonfamily households that have nonrelatives present. About 80 percent of nonfamily households with nonrelatives had only one nonrelative in residence. Places with more than eight residents not related to the householder are considered to be group quarters and are not counted as households.

Tenure. Tenure refers to whether the housing unit is owned or rented by the occupants. Householders are considered "owners" if they own or are in the process of buying the unit. The householders that are not classified as owners are "renters" regardless of whether they actually pay cash rent or not. Family householders were much more likely to be owners than nonfamily householders in 1984 (72 percent of families versus 45 percent of nonfamilies).

AVERAGE HOUSEHOLD SIZE

As previously mentioned, the average number of persons per household in 1984 stood at an unprecedented low of 2.71 persons. The earliest recorded average household size for the United States is for 1790, at which time there were 5.79 persons per household. Over 100 years later, the average for

---

[4] The 1970 figure is based on unpublished data from the Current Population Survey.

[5] The difference in the average size of families maintained by men or women alone is not considered statistically significant.

1900 of 4.76 persons was still comparatively high by today's standards.[*]

In more recent years household size has declined from 3.14 persons in 1970 to 2.76 persons in 1980. Household size did not change significantly between 1981 and 1983, but there was a further small drop in the average during the 1983-84 period. Much of the decline in household size from both the 1970-80 and 1980-84 periods has been due to the dramatic increase in the number of one- or two-person households.

From 1970 to 1980, there was a net increase of about 17.4 million households. During the 10-year period, larger households containing five or more persons declined by 2.9 million, whereas those with one to four persons increased by 20.3 million (table G). About 71 percent of the increase in households of less than five persons was concentrated among those consisting of just one or two persons.

Since 1980, the net increase in the total number of households has been 4.6 million. The number of five-person households did not decline in the 1980's as it did in the 1970's, but households of six or more persons decreased by 531,000, while those with one to five persons increased by 5.2 million. Approximately 62 percent of the increase in households of one to five persons was among those with either one or two members.

The decline over the years in the average number of persons per household has had a variety of ramifications related to the size of housing units needed and the characteristics of a host of other products and services required. There is a point beyond which household size cannot continue to decline. The trend toward smaller households has been considerably slower since 1980 than it was during the 1970's. It is possible that the decline in household size could reverse later in the 1980's, but a substantial increase in the average is certainly not anticipated at any time in the near future.

RELATED REPORTS

Data for 1984 and earlier years on households and families by type were published in Series P-20, No. 391, *Households, Families, Marital Status, and Living Arrangements: March 1984 (Advance Report)*. Figures for 1984 on the sex, age, marital status, and living arrangements of persons appear in the forthcoming *Marital Status and Living Arrangements: March 1984*. Projections for the United States of the number of households and families from 1979 to 1995 were last published in Series P-25, No. 805. Additional data for years since 1947 on subjects covered in this report have been published by the Bureau of the Census in other reports in Series P-20, P-23, and P-25. See detailed listing at the end of this publication.

Statistics on households, families, and related subjects for specific standard metropolitan statistical areas, counties, urbanized areas, cities, States, regions, and the United States are available from the 1980 Census of Population. The data are presented in Volume 1, *Characteristics of the Population*, Chapters B, C, and D.

Appendix A. Definitions and Explanations

Coverage. The population in this report includes the civilian noninstitutional population of the United States plus approximately 879,000 members of the Armed Forces in the United States living off post or with their families on post in 1984 but excludes all other members of the Armed Forces.

Symbols. A dash (-) represents zero or rounds to zero. The symbol "B" means that the base for the derived figure is less than 75,000. An "X" means not applicable, and "NA" means not available.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Age. The age classification is based on the age of the person at the person's last birthday. The adult universe (i.e., population of marriageable age) is now comprised of persons 15 years old and over. Prior to 1980 the adult universe was 14 years old and over.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black.

Persons of Spanish origin. Persons of Spanish origin in this report were determined on the basis of a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (or the origin of some other household member) from a "flash card" listing ethnic origins. Persons of Spanish origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Spanish origin. Persons of Spanish origin may be of any race.

Marital status. The marital status classification identifies four major categories: single (never married), married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is further divided into "married, spouse present," "separated," and "other married, spouse absent." A person was classified as "married, spouse present" if the husband or wife was reported as a member of the household, even though he or she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The group "other married, spouse absent" includes married persons living apart because either the husband or wife was employed and living at a considerable distance from home, was serving away from home in the Armed Forces, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

Husband in Armed Forces. When a woman was reported as married but her husband was not enumerated as a member of the same household, an additional question was asked to determine whether her husband was in the Armed Forces. Women who were reported as separated were not asked the additional question.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is direct access from the outside or through a common hall.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Group quarters. As of 1983 group quarters were defined in the Current Population Survey as noninstitional living arrangements for groups not living in conventional housing units or groups living in housing units containing nine or more persons (or prior to 1983 five or more persons) unrelated to the person in charge. Since 1972, inmates of institutions have not been included in the Current Population Survey.

Householder. The householder refers to the person (or one of the persons) in whose name the housing unit is owned or rented (maintained) or, if there is no such person, any adult member, excluding roomers, boarders, or paid employees. If the house is owned or rented jointly by a married couple, the householder may be either the husband or the wife. The person designated as the householder is the "reference person" to whom the relationship of all other household members, if any, is recorded.

Prior to 1980, the husband was always considered the householder in married-couple households. The number of householders is equal to the number of households. Also, the number of family householders is equal to the number of families.

Head versus householder. Beginning with the 1980 CPS, the Bureau of the Census discontinued the use of the terms "head of household" and "head of family." Instead, the terms "householder" and "family householder" are used. Recent social changes have resulted in greater sharing of household responsibilities among the adult members and, therefore, have made the term "head" increasingly inappropriate in the analysis of household and family data. Specifically, the Bureau has discontinued its longtime practice of always classifying the husband as the reference person (head) when he and his wife are living together.

In this report, the term "householder" is used in the presentation of data that had previously been presented with the designation "head." The householder is the first adult household member listed on the questionnaire. The instructions call for listing first the person (or one of the persons) in whose name the home is owned or rented. If a home is owned jointly by a married couple, either the husband or the wife may be listed first, thereby becoming the reference person, or householder, to whom the relationship of other household members is to be recorded.

Family. A family is a group of two persons or more (one of whom is the householder) related by birth, marriage, or adoption and residing together; all such persons (including related subfamily members) are considered as members of one family. Beginning with the 1980 CPS, unrelated subfamilies (referred to in the past as secondary families) are no longer included in the count of families, nor are the members of unrelated subfamilies included in the count of family members.

Family household. A family household is a household maintained by a family (as defined above), and any unrelated persons (unrelated subfamily members and/or secondary individuals) who may be residing there are included. The number of family households is equal to the number of families. The count of family household members differs from the count of family members, however, in that the family household members include all persons living in the household, whereas family members include only the householder and his/her relatives. (See the definition of family.)

Related subfamily. A related subfamily is a married couple with or without children, or one parent with one or more own single (never married) children under 18 years old, living in a household and related to, but not including, the person or couple who maintains the household. The most common example of a related subfamily is a young married couple sharing the home of the husband's or wife's parents. The number of related subfamilies is not included in the count of families.

Unrelated subfamily. An unrelated subfamily (formerly called a secondary family) is a group of two persons or more who are related to each other by birth, marriage, or adoption, but who are not related to the householder. The unrelated subfamily may include persons such as guests, roomers, boarders, or resident employees and their relatives living in a household. The number of unrelated subfamily members is included in the number of household members but is not included in the count of family members.

Persons living with relatives in group quarters were formerly considered as members of unrelated subfamilies. However, the number of such unrelated subfamilies became so small (37,000 in 1967) that beginning with data for 1968 (and beginning with census data for 1960) the Bureau of the Census includes persons in these unrelated subfamilies in the count of secondary individuals.

Family group. A family group is any two or more persons (not necessarily including a householder) residing together, and related by birth, marriage, or adoption. A household may comprise one such group, more than one, or none at all. The count of family groups includes family households, related subfamilies, and unrelated subfamilies.

Married couple. A married couple, as defined for census purposes, is a husband and wife enumerated as members of the same household. The married couple may or may not have children living with them. The expression "husband-wife" or "married-couple" before the term "household," "family," or "subfamily" indicates that the household, family, or subfamily is maintained by a husband and wife. The number of married couples equals the count of married-couple families plus related and unrelated married-couple subfamilies.

Unrelated individuals. Unrelated individuals are persons of any age (other than inmates of institutions) who are not living with any relatives. An unrelated individual may be (1) a person living alone or with nonrelatives only, (2) a roomer, boarder, or resident employee with no relatives in the household, or (3) a group quarters member who has no relatives living with him/her. Thus, a widow who occupies her house alone or with one or more other persons not related to her, a roomer not related to anyone else in the housing unit, a maid living as a member of her employer's household with no relatives in the household, and a resident staff member in a hospital living apart from any relatives are all examples of unrelated individuals.

Nonfamily householder. A nonfamily householder (formerly called a primary individual) is a person maintaining a household while living alone or with nonrelatives only.

Secondary individual. A secondary individual is a person in a household or group quarters such as a guest, roomer, boarder, or resident employee (excluding nonfamily householders and inmates of institutions) who is not related to any other person in the household or group quarters. (See section on unrelated subfamily for slight change in coverage of secondary individuals in 1968.)

Size of household, family, or subfamily. The term "size of household" includes all persons occupying a housing unit. "Size of family" includes the family householder and all other persons in the living quarters who are related to the householder by birth, marriage, or adoption. "Size of related subfamily" includes the husband and wife or the lone parent and their never-married sons and daughters under 18 years of age. "Size of unrelated subfamily" includes the reference person and all other members related to the reference person. If a family has a related subfamily among its members, the size of the family includes the members of the related subfamily.

Related persons and family members. In the classification of households by number of related persons, the person or couple who maintains the household or (housing unit) and all persons in the household related to them are included. In the classification of families by number of family members, all persons in the family are included. The number of family members is the same as the size of the family.

Own children and related children. "Own" children in a family are sons and daughters, including stepchildren and adopted children, of the householder. Similarly, "own" children in a subfamily are sons and daughters of the married couple or parent in the subfamily. (All children shown as members of related subfamilies are own children of the person(s) maintaining the subfamily.) "Related" children in a family include own children and all other children in the household who are related to the householder by birth, marriage, or adoption. For each type of family unit identified in the CPS, the count of own children under 18 years old is limited to single (never married) children; however, "own children under 25" and "own children of any age," as the terms are used here, include all children regardless of marital status. The totals include never-married children living away from home in college dormitories.

The count of related children in families was formerly restricted to single (never married) children. However, beginning with data for 1968 the Bureau of the Census includes ever-married children under the category of related children. This change added approximately 20,000 children to the category of related children in March 1968.

Tenure. A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," including units rented for cash rent and those occupied without payment of cash rent.

Units in structure. In the determination of the number of units in a structure, all housing units, both occupied and vacant, were counted. The statistics are presented in terms of the number of occupied housing units in structures of specified size, not in terms of the number of residential structures.

Years of school completed. In this report, data on years of school completed were derived from the combination of answers to two questions, (a) "What is the highest grade of school that the person has attended?" and (b) "Did the person finish this grade?"

The questions on educational attainment applied only to progress in "regular" schools. Such schools include public, private, and parochial schools (elementary, junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, "regular" schooling is that which advances a person toward an elementary or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

Labor force and employment status. The definitions of labor force and employment status in this report relate to the population 15 years old and over.

Employed. Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific job-seeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" consists of all civilians classified as employed or unemployed.

Not in the labor force. All civilians who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work, seasonal workers for whom the survey week fell in an off season, and the voluntary idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

Occupation. The data on occupation of employed persons refer to the civilian job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week.

In 1980, the Bureau of the Census revised the Standard Occupational Classification System (SOC) for use in its tabulation program for the 1980 census and subsequent published reports on occupational data. Consequently, the new classification system was incorporated into the CPS tabulation program in January 1983. While the new system provides comparability between the CPS and other data sources, it causes a break in continuity for all CPS series containing occupational data.

Differences between the 1970 and 1980 occupational systems affect classifications at all levels. Such commonly used identifiers as white-collar, blue-collar, professional and technical, craft workers, and operative occupations have been eliminated. These identifiers have been replaced with new categories which represent conceptual as well as language changes. Moreover, many of the components of the former groupings have been shifted to such an extent that they cannot be made to correspond readily to the new categories. For a more complete explanation and description of the changes from the old to new occupational classification system see the February 1983 issue of "Employment and Earnings" by the Bureau of Labor Statistics.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central county. In New England, SMSA's consist of towns and cities, rather than counties. The metropolitan population in this report is based on SMSA's as defined in the 1970 census and does not include any subsequent additions or changes.

Central cities. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. If only one central city is designated, then it must have 50,000 inhabitants or more. The area title may include, in addition to the largest city, up to two city names on the basis and in the order of the following criteria: (1) The additional city has at least 250,000 inhabitants or (2) the additional city has a population of one-third or more of that of the largest city and a minimum population of 25,000. An exception occurs where two cities have contiguous boundaries and constitute, for economic and social purposes, a single community of at least 50,000.

Income. Data on income cover money income only, prior to deduction for taxes, received from such sources as wages or salaries, net income from self-employment, Social Security, dividends, interest, public assistance and welfare, unemployment compensation, government pensions, and veterans payments. Certain money receipts such as capital gains are not included. For a more detailed explanation, see Bureau of the Census, Current Population Reports, Series P-60.

Appendix B. Source and Reliability of Estimates

SOURCE OF DATA

The estimates in this report are based on data obtained from the Current Population Survey (CPS) of the Bureau of the Census. The CPS estimates are based on data obtained in March of 1970, 1980, 1982, 1983, and 1984. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member 14 years old and older in every sample household. In order to obtain more reliable data for the Spanish-origin population, the March CPS sample was enlarged to include all households from the previous November sample which contained at least one sample person of Spanish origin. For this report, persons in the Armed Forces living off post or with their families on post are included.

The present CPS sample was initially selected from the 1970 census files with coverage in all 50 States and the District of Columbia. The sample is continually updated to reflect new construction. The current CPS sample is located in 629 areas comprising 1,148 counties, independent cities, and minor civil divisions in the Nation. In this sample, approximately 61,500 occupied households were eligible for interview. Of this number, about 2,500 occupied units were visited but interviews were not obtained because the occupants were not found at home after repeated calls or were unavailable for some other reason.

The following table provides a description of some aspects of the CPS sample designs in use during the referenced data collection periods. The estimation procedure used in this survey involved the inflation of the weighted sample results to independent estimates of the total civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from decennial censuses; statistics on births, deaths, immigration and emigration; and statistics on the strength of the Armed Forces.

Description of March Current Population Survey

Time period	Number of sample areas[1]	Housing units eligible	
		Interviewed	Not interviewed
1982 to 1984..	629	59,000	2,500
1980..........	629	65,500	3,000
1970..........	449	48,000	2,000

[1] These areas were chosen to provide coverage in each State and the District of Columbia.

The independent population estimates used in this report to obtain data for March 1980 and later are based on the 1980 decennial census. Data for 1970 was obtained using independent population estimates based on the 1970 decennial census. The estimation procedure for the data also involved a further adjustment so that husband and wife of a household receive the same weight.

RELIABILITY OF ESTIMATES

Since the estimates in these tabulations are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaire, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling. The standard errors provided for this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. The full extent of nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

Nonsampling variability. Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness on the part of the respondents to provide correct information, inability to recall information, errors made in collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage, as compared to the level of the 1980 decennial census, is about 7 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Black and other races combined than for Whites. Ratio estimation to independent age-sex-race population controls, as described previously, partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics from interviewed persons in the same age-sex-race group. Further, the independent population controls used have not been adjusted for undercoverage in the decennial census.

For additional information on nonsampling error including the possible impact on CPS data when known, refer to Statistical Policy Working Paper No. 3, *An Error Profile: Employment as Measured by the Current Population Survey*, Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978 and Technical Paper 40, *The Current Population Survey: Design and Methodology*, Bureau of the Census, U.S. Department of Commerce.

COMPARABILITY WITH OTHER DATA

Caution should be used when comparing estimates for 1980 and later, which reflect 1980 census-based population controls, to that for 1970, which reflect 1970 census-based population controls. This change in population controls had relatively little impact on summary measures such as means, medians, and percent distributions, but did have a significant impact on levels. For example, use of the 1980-based population controls resulted in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels for 1980 and later will differ from those for earlier years by more than what could be attributed to actual changes in the population and these differences could be disproportionately greater for certain subpopulation groups than for the total population.

Sampling variability. The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variations that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its standard error enable one to construct confidence intervals, ranges that would include the average result of all possible samples with a known probability. For example, if all possible samples were selected, each of these being surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then:

1. Approximately 68 percent of the intervals from one standard error below the estimate to one standard error above the estimate would include the average result of all possible samples.

2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.

3. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.

The average estimate derived from all possible samples is or is not contained in any particular computed interval. However, for a particular sample, one can say with a specified confidence that the average estimate derived from all possible samples is included in the confidence interval.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common types of hypotheses are 1) the population parameters are identical or 2) they are different. An example of this would be comparing the average size of households maintained by male householders versus that maintained by female householders. Tests may be performed at various levels of significance, where a level of significance is the probability of concluding that the parameters are different when, in fact, they are identical.

All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better, and most have passed a hypothesis test at the 0.05 level of significance or better. This means that, for most differences cited in the text, the estimated difference between parameters is greater than twice the standard error of difference. For the other differences mentioned, the estimated difference between parameters is between 1.6 and 2.0 times the standard error of the difference. When this is the case, the statement of comparison will be qualified in some way; e.g., by use of the phrase "some evidence."

Note when using small estimates. Summary measures (such as averages and percent distribution) are shown when the base is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for the corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's need.

Standard error tables and their use. In order to derive standard errors that would be applicable to a large number of estimates and could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

The figures in tables B-1 and B-2 provide approximations to standard errors of estimated numbers and estimated percentages. Estimated standard errors for specific characteristics cannot be obtained from tables B-1 and B-2 without the use of factors in table B-3. These factors must

Table B-1. Standard Errors of Estimated Numbers

(Numbers in thousands)

Size of estimate	Standard error
25	9
50	13
100	19
250	30
500	42
1,000	59
2,500	93
5,000	131
10,000	182
15,000	221
25,000	277
50,000	364
100,000	424

Note: For a particular characteristic see table B-3 for the appropriate factor to apply to the above standard errors.

be applied to the generalized standard errors in order to adjust for the combined effect of sample design and estimating procedure on the value of the characteristic. Standard errors for intermediate values not shown in the generalized tables of standard errors may be approximated by linear interpolation. The factors for all household members should be used for characteristics pertaining to all persons in a household. For characteristics which include only some household members, such as "children under 18 years of age," the factor for some household members should be used.

Two parameters (denoted "a" and "b") are used to calculate standard errors for each type of characteristic; they are presented in table B-4. These parameters were used to calculate the standard errors in tables B-1 and B-2, and to calculate the factors in table B-3. They also may be used to calculate directly the standard errors for estimated numbers and percentages. Methods for direct computation are given in the following sections.

Standard errors of estimated numbers. The approximate standard error, σ_x, of an estimated number can be obtained in two ways. It may be obtained by use of the formula

$$\sigma_x = f\sigma \qquad (1)$$

where f is the appropriate factor from table B-3, and σ is the standard error on the estimate obtained by interpolation from table B-1. Alternatively, standard errors may be approximated by using formula (2), from which the standard errors were calculated in table B-1. Use of this formula will provide more accurate results than the use of formula (1) above.

$$\sigma_x = \sqrt{ax^2 + bx} \qquad (2)$$

Here x is the size of the estimate and a and b are the parameters in table B-4 associated with the particular type of characteristic. When calculating standard errors for numbers from cross-tabulations involving different characteristics, use the factor or set off parameters for the characteristic which will give the largest standard error.

Illustration of the computation of the standard error of an estimated number. Table A of this report shows that in 1984 there were 23,410,000 nonfamily households. Using formula (2) with a = -0.000010 and b = 1389 from table B-4, the approximate standard error[1] is

$$\sqrt{(-0.000010)\,(23{,}410{,}000)^2 + (1389)\,(23{,}410{,}000)} \doteq 164{,}000$$

The 68-percent confidence interval for the number of nonfamily households is from 23,246,000 to 23,574,000. The 95-percent confidence interval is from 23,082,000 to 23,738,000 (using twice the standard error). Therefore, a conclusion that the average estimate derived from all possible

Table B-2. Standard Errors of Estimated Percentages

Base of estimated percentage (thousands)	Estimated percentage					
	1 or 99	2 or 98	5 or 95	10 or 90	25 or 75	50
75	2.1	3.0	4.7	6.5	9.4	10.8
100	1.9	2.6	4.1	5.6	8.1	9.4
250	1.2	1.7	2.6	3.5	5.1	5.9
500	0.8	1.2	1.8	2.5	3.6	4.2
1,000	0.6	0.8	1.3	1.8	2.6	3.0
2,500	0.4	0.5	0.8	1.1	1.6	1.9
5,000	0.3	0.4	0.6	0.8	1.1	1.3
10,000	0.2	0.3	0.4	0.6	0.8	0.9
15,000	0.15	0.2	0.3	0.5	0.7	0.8
25,000	0.12	0.2	0.3	0.4	0.5	0.6
50,000	0.08	0.12	0.2	0.3	0.4	0.4
100,000	0.06	0.08	0.13	0.2	0.3	0.3

Note: For a particular characteristic see Table B-3 for the appropriate factor to apply to the above standard errors.

---

[1] Using formula (1), table B-1 and the appropriate factor from table B-3, the approximate standard error is 0.63 x 268,000 = 169,000.

samples lies within a range computed in this way would be correct for roughly 95 percent of all possible samples.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameters from table B-3 or B-4 indicated by the numerator. The approximate standard error, $\sigma_{(x,p)}$, of an estimated percentage can be obtained by use of the formula

$$\sigma_{(x,p)} = f\sigma \qquad (3)$$

In this formula, f is the appropriate factor from table B-3, and σ is the standard error on the estimate from table B-2. Alternatively, standard errors may be approximated by using formula (4), from which standard errors in table B-2 were calculated; direct computation will give more accurate results than use of formula (3).

$$\sigma_{(x,p)} = \sqrt{\frac{b}{x} \cdot p(100 - p)} \qquad (4)$$

Here x is the size of the subclass of persons, families, unrelated individuals, households, or householders, which is the base of the percentage, p is the percentage $(0 < p < 100)$ and b is the parameter in table B-4 associated with the particular type of characteristic in the numerator of the percentage.

Illustration of the computation of the standard error of a percentage. Table A shows that of the 85,407,000 households in 1984, 58.6 percent were maintained by married couples. From table B-4, the appropriate b-parameter is 1,389. Using formula (4), the approximate standard error[2] on 58.6 is

$$\sqrt{\frac{1,389}{85,407,000}(58.6)\ (41.4)} \doteq 0.2 \text{ percent}$$

Thus, the 68-percent confidence interval for the percentage of households maintained by married couples in 1984 is from 58.4 to 58.6, and the 95-percent confidence interval is from 58.2 to 59.0.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to

$$\sigma_{(x-y)} = \sqrt{\sigma_x^2 + \sigma_y^2} \qquad (5)$$

where σ_x and σ_y are the standard errors of the estimates x and y; the estimates can be of numbers, percents, ratios, etc. This will represent the actual standard errors quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration of the computation of the standard error of a difference. As stated earlier, table A shows that in 1984, 58.6 percent of all households were maintained by married couples. Table A also shows that in 1970, 70.5 percent of all households were maintained by married couples. Thus, the apparent difference between the percent of households maintained by married couples in 1984 and 1970 is 11.9 percent. The standard error (σ_x) of 58.6 percent is 0.2 percent as shown above. Using formula (4) and the appropriate b parameter (1,389) from table B-4, the approximate standard error (σ_y) of 70.5 percent is 0.2 percent. Therefore, using formula (5), the standard error of the estimated difference of 11.9 percent is about

$$\sqrt{(0.2)^2 + (0.2)^2} \doteq 0.3 \text{ percent}$$

This means that the 68-percent confidence interval on the difference between the households maintained by married couples in 1983 and 1970 is from 11.6 to 12.2 percent. The 95-percent confidence interval on the difference of 11.9 percent is from 11.3 to 12.5 percent. Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 95 percent of all possible samples. Since this interval does not contain zero, we can conclude with 95-percent confidence that the percent of households maintained by married couples in 1984 decreased from 1970.

Standard error of a ratio. Certain mean values for persons in families or households shown in the tables of this report were calculated as the ratio of two numbers. For example, the mean number of persons per family or household is calculated as

$$\frac{x}{y} = \frac{\text{total number of persons in families or households}}{\text{total number of families or households}}$$

Standard errors for these means may be approximated as shown below. There are two cases to consider. In either case, the denominator y represents a count of families or households of a certain class, and the numerator x represents a count of persons with the characteristic under consideration who are members of these families or households.

Case 1: There is at least one person having the characteristic in every family or household of the class: as an example, the mean number of persons per family or the mean number of persons per family with a male householder. For ratios of this

---

[2] Using formula (3), tables B-2 and B-3, the approximate standard error is also 0.2 percent.

Table B-3. Factors to be Applied to Generalized Standard Errors in Tables B-1 and B-2

Characteristic	Persons						Families and unrelated individuals, households, or householders		
	Some household members and secondary individuals			All household members					
	Total or White	Black	Spanish origin	Total or White	Black	Spanish origin	Total or White	Black	Spanish origin

(X) Not applicable.

[1] Apply this factor to table B-2 to obtain standard errors of estimated percentages; for standard errors of estimated levels, use a = 0.000481, b = 1096, and formula (2).

kind, the standard errors are approximated by the following formula:

$$\sigma_{\frac{x}{y}} = \sqrt{\left(\frac{x}{y}\right)^2 \left[\left(\frac{\sigma_x}{y}\right)^2 + \left(\frac{\sigma_x}{x}\right)^2 - 2\varrho\left(\frac{\sigma_x}{x}\right)\left(\frac{\sigma_y}{x}\right)\right]} \qquad (6)$$

The standard error of the estimated number of families or households, σ_y, and the standard error of the estimated number of persons with the characteristics in those families or households, σ_x, may be calculated by the methods described above. In formula (6), ϱ represents the correlation coefficient between the numerator and the denominator of the estimate. In the above example, and for other ratios of this kind, use 0.7 as an estimate of ϱ.

Case 2: The number of persons having the characteristic in a given family or household may be 0, 1, 2, 3, or more: for example, the mean number of persons under 18 years of age per household. For ratios of this kind the standard error is approximated by formula (6), but ϱ is assumed to be zero. If ϱ is actually positive (negative), then this procedure will provide an overestimate (underestimate) of the standard error of the ratio.

Confidence intervals and standard errors of medians. The sampling variability of an estimated median depends upon both the form of the cumulative relative distribution of the specified characteristic and the size of its base. An approximate method of measuring the reliability of a median is to determine an interval about it, such that there is a stated degree of confidence that the median based on a complete census lies within the interval. The following procedure may be used to estimate the 68-percent confidence limits of a median based on sample data.

1. Determine the standard error on a 50-percent characteristic using formula (3) or (4).

2. Add to and subtract from 50 percent, the standard error determined in step (1).

3. Using the distribution of the characteristic, calculate the values from the distribution corresponding to the two points established in step (2). The values will be the limits for the confidence interval.

Use the formula below and the tabulated cumulative relative distribution of the characteristic to interpolate between values.

$$X = \frac{(L - A_1)}{(A_2 - A_1)} \times (T_2 - T_1) + T_1 \qquad (7)$$

where X = the interpolated estimate of the upper or lower limit;

L = the upper or lower limit obtained from step (2);

A_1 and A_2 = the lower and upper values of the cumulative relative frequency for the limits of the interval which contains L; and

T_1 and T_2 = the lower and upper values of the characteristic in the interval which contains L.

The standard error of the median can be approximated by the formula:

$$\sigma_{\text{median}} = \frac{X_U - X_L}{2} \qquad (8)$$

where X_U = the upper limit of the 68-percent confidence interval; and

X_L = the lower limit of the 68-percent confidence interval.

A 95-percent confidence interval for the median can be computed by using the preceding procedure and changing step (2) to read:

Add to and subtract from 50 percent, twice the standard error determined in step (1).

Illustration of the computation of a confidence interval and standard error for a median. Table F of this report shows that

[1] Use this parameter to calculate standard errors of estimated percentages only.

[2] Use these parameters to calculate standard errors of estimated levels only.

in 1984 the median age of the householder of married-couple families was 44.9 years. Table F also indicates the base of the distribution from which this median was determined is 50,090,000 married-couple families.

1. Using formula (4), and the appropriate b parameter from table B-4 the standard error of 50 percent on a base of 50,090,000 is

$$\sqrt{\frac{1,389}{50,090,000}\, 50.0\,(100 - 50.0)} \pm 0.3 \text{ percent}$$

2. To obtain a 68-percent confidence interval on an estimated median, add to and subtract from 50 percent the standard error found in step (1). This yields percent limits of 49.7 and 50.3.

3. Since 27.8 percent of the householders of married-couple families were under 35 years of age and 50.1 percent were under 45 (table F), the lower limit of the estimate may be found, by using formula (7), to be

$$\frac{49.7 - 27.8}{50.1 - 27.8} \times (45.0 - 35.0) + 35.0 = 44.8$$

4. Similarly, since 50.1 percent of the householders of married-couple families were under 45 and 67.4 percent were under 55 (table F), the upper limit of the estimate may be found to be

$$\frac{50.3 - 50.1}{67.4 - 50.1} \times (55.0 - 45.0) + 45.0 = 45.1$$

Thus, an approximate 68-percent confidence interval for the median age of householders of married-couple families is from 44.8 to 45.1 years.

Applying formula (8) the standard error of the median can be approximated:

$$\sigma_{\text{median}} = \frac{45.1 - 44.8}{2} = 0.2$$
